In the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application.

- 1-59. (Canceled)
- 60. (New) A stud for use in panel form work for solid filled walls, the stud comprising:

a head formed as a strip adapted to be bonded and/or fastened to an inner face of a panel facing sheet, and

a pair of spaced, opposed flanges formed along and extending away from a central portion of the head, the flanges defining a recess with inwardly directed teeth for engagement of a spacer element,

wherein the passage of a suitably dimensioned spacer element into the recess deforms the flanges and causes the inwardly directed teeth to engage the spacer element.

- 61. (New) The stud of claim 60 wherein the width of the head is substantially greater than the spacing of the flanges on the central portion of the head.
- 62. (New) The stud of claim 60 wherein the width of the head is approximately seven times the spacing between the flanges.
- 63. (New) The stud of claim 60 wherein the flanges are resiliently deformable outwardly by passage of the spacer element to thereby engage the spacer element by compressive contact with the teeth.
- 64. (New) The stud of claim 60 having a cross sectional configuration, formed by the strip and the pair of flanges, which is substantially T-shaped.

- 65. (New) The stud of claim 60 having two or more teeth extending longitudinally along each flange inside the recess.
- 66. (New) The stud of claim 60 wherein each flange has an out-turned terminal lip to guide passage of the spacer element into the recess.
- 67. (New) The stud of claim 60 wherein the head, flanges and teeth are formed integrally as an extrusion.
 - 68. (New) A building panel containing a stud according to claim 60.
- 69. (New) A form work panel for solid filled walls, including:
 a pair of facing sheets spaced apart by a plurality of stud assemblies,
 the stud assemblies each having a pair of parallel strip-like studs held together by a
 plurality of spacer elements,

the stude each having a head attached to a respective panel and a pair of parallel flanges which form a recess extending from a central portion of the head into the interior of the panel,

each spacer in a stud assembly having tongues which engage respective recesses in the pair of studs, and

each recess in a stud having teeth formed on the flanges to engage the tongues of the spacer elements.

- 70. (New) A panel according to claim 69 wherein the head of each stud attached to a respective facing sheet is substantially wider than the width of the spacers.
- 71. (New) A panel according to claim 69 wherein the width of the head of each stud is more than double the width of the recess formed by the flanges.
- 72. (New) A panel according to claim 69 wherein each head has a relatively broad flat surface attached to a respective panel by way of adhesive.

73. (New) A solid filled wall including a panel as claimed in claim 69 filled with concrete.
